

FOOD DELIVERY ANALYTICS DASHBOARD

1. Project Overview

This project analyzes food delivery data to uncover insights about:

- Restaurant performance
- Customer behavior
- Delivery efficiency
- Payment preferences

2. Dataset Description

Total Records: 3,000 Data Type: Mixed (Categorical + Numerical + Date) Source: Simulated dataset for analytics practice

Column	Description
Restaurant	Name of the restaurant
FoodItem	Ordered food item
Quantity	Number of items ordered
OrderValue	Value before charges
TotalAmount	Final billed amount
DeliveryTime_Minutes	Delivery duration
CustomerRating	Rating given by customer
City	Location of the order
PaymentMethod	Mode of payment
OrderDate	Date of the order

3. Business Problem

Food delivery companies need to balance:

- Customer satisfaction
- Delivery speed
- Profitability

Objectives:

1. Identify top-performing restaurants
2. Understand customer preferences
3. Optimize delivery operations
4. Improve payment experience

4. Methodology

1: Data Cleaning

- Removed duplicates and handled missing values
- Standardized categorical entries (e.g., payment methods)
- Converted date columns to datetime format

2: Exploratory Data Analysis (EDA)

- Univariate: Distribution of ratings, delivery times, and payment methods
- Bivariate: Relationship between delivery time and customer rating
- Multivariate: Impact of city, restaurant, and payment method on order value

3: Visualization

- Bar charts for restaurant performance
- Histograms for delivery time distribution
- Heatmaps for correlation analysis
- Pie charts for payment method share

Step 4: Dashboard Creation

- Built an interactive Power BI dashboard with slicers for city, restaurant, and payment method
- Included KPIs: Total Revenue, Average Delivery Time, Customer Rating

5. Insights (5 Key Findings)

1. Top Revenue Cities: Mumbai and Delhi contribute over 60% of total revenue.
2. Fastest Deliveries: Taco Town and Grill Master have the shortest delivery times (<25 minutes).
3. Customer Satisfaction: Veg Express and Grill Master maintain ratings above 4.5 consistently.
4. Payment Trends: UPI is the most preferred payment method; cash usage is minimal.
5. Seasonality: Orders peak between May and July, indicating summer demand surge.

6. Summary of Findings

- Delivery time strongly correlates with customer rating — faster deliveries yield higher satisfaction.
- High-rated restaurants tend to have optimized delivery workflows and consistent order values.
- Payment digitization (UPI, Wallets) dominates urban areas, showing customer preference for convenience.
- Seasonal trends can guide promotional campaigns and staffing decisions.
